**PLANMECA**  
ProOne

## *Efficiency with elegance*

Simple is beautiful. Planmeca designed their fully digital Planmeca ProOne, an all-round dental X-ray unit, with simplicity in mind. Still, no compromises were made in applying the latest state-of-the-art technology. In Planmeca ProOne, compact dimensions and ease of use are combined with extensive diagnostic capabilities and superior image quality. Planmeca ProOne truly inherits Planmeca's expert knowledge and long traditions in dental imaging.

*For every dentist*

The fully digital Planmeca ProOne X-ray unit provides absolute ease of use with cutting edge technology. The wide selection of exposure programs and parameters on the unit graphical user interface ensures that all types of radiographic examinations are highly rapid and effortless to perform. Being small-sized, Planmeca ProOne brings the benefits of digital imaging within the reach of every dentist the world over.

The side entry and open patient positioning minimise errors caused by incorrect patient positioning, one of the most frequent reasons for failed radiographs. Patient positioning is made quick, precise, and easy, as the user may monitor the patient freely from the front and side.

Patient positioning is assisted by a triple laser beam system which accurately indicates the correct anatomical positioning points. The midsagittal plane positioning beam shows the correct sideways alignment of the

patient's head. The Frankfort horizontal plane positioning beam allows the correct head forward tilt. The focal layer positioning beam indicates the focal layer's position in the incisor region which helps position the patient accurately inside the focal layer for a sharp and clear image.

The ProOne side entry allows easy access for all patients; the exposure can be performed of a standing or a seated patient. If necessary, the patient can even remain seated on a wheelchair or lay in a hospital bed with upright lifted backrest. In Planmeca ProOne, no mirrors are needed for patient positioning. Instead, the patient has an open and comfortable view, so for instance a small child can see the accompanying adult at every stage of the exposure.

The Planmeca ProOne X-ray unit requires neither assembling nor adjustments, which is not the case with most X-ray units on the market. Planmeca ProOne is delivered fully assembled, in one package, and ready-to-mount. Which is why the installation is rapid and straightforward. All one has to do is to fix the X-ray unit on a wall or on a free-standing base, and the unit is ready for immediate use.

*Ease of operation*

Standard Panoramic

Pediatric

Bitewing

Lateral Double TMJ

Cross-sections

PA Double TMJ

Planmeca ProOne provides a variety of all-round imaging programs for different radiographic needs. Besides the Standard Panoramic program, the following three special panoramic programs are provided for more specific diagnostic needs: Improved Interproximal program, Improved Orthogonal program, and Bitewing program.

Planmeca ProOne also allows you to select the right exposure format, minimising the radiation dose for all types of patients and diagnostic purposes.

To produce accurate and undistorted radiographs, the form of the focal layer was designed to follow the scientifically defined shape of human dental arch and jaw. Such a focal layer provides panoramic radiographs with clearly superior clinical quality. The imaging geometry efficiently eliminates shadows and ghost images caused by objects outside the image layer, which significantly increases the diagnostic value of the radiograph.\*

The optional Improved Interproximal program produces a panoramic image with open interproximal contacts. Such a radiograph is especially useful in caries detection.

An image taken with the unit Bitewing program, which utilises the improved interproximal projection geometry, is similar to an intraoral bitewing image pair. The advantage is that the image is obtained with one simple extraoral exposure and a very low radiation dose.

The optional Improved Orthogonal program produces an image where the alveolar crest is clearly visible for enhanced diagnostics of periodontal condition and traumas.

The Pediatric program automatically reduces the exposed area from top and sides, which results in a 20% lower patient dose, without loss of diagnostic information.

With the Segmenting program, the exposed area can be limited only to the area of diagnostic interest. With a simple selection on the GUI, the patient dose can be reduced by up to 90% compared to a full area panoramic exposure.\*\*

The Sinus program has a specially designed image layer providing a radiograph with a clear view of the maxillary sinuses.

The automatic Double TMJ program produces a lateral or posteroanterior view of open and closed temporomandibular joints on one radiograph. While the imaging procedure is straightforward, the radiograph allows easy diagnosis of the TMJ condition in one view.

The Cross-section program is intended for simple cross-sectional imaging of TMJs and jaws in molar and premolar region. These images convey highly valuable information on cross-sectional dimensions and the structure of the jaw.

Effective image adjustment tools

Easy and accurate measurements

Planmeca Dimaxis handles all image types

Direct digital radiography offers many advantages both for the patient and for the imaging workflow.

- Direct digital X-ray imaging saves time. The image is visible on the computer screen within seconds after the exposure, and thereby immediately available for diagnosis.
- As films, film processing, and darkrooms are left behind, the most common reasons for failed images are eliminated.
- Digital images can be enhanced in the imaging software. This results in more accurate diagnoses.
- Digital archives and networks enable efficient image communications.

The digital Planmeca ProOne is supplied with the Planmeca Dimaxis imaging software. Planmeca Dimaxis includes the following dynamic and easy-to-use image processing tools:

- Adjustments of the image greyscale for optimal image contrast and darkness
- Filters for image sharpening and noise reduction
- Angle, length, and level measurements
- Imaging communications through annotations, diagnose window, image export, and printing.

The versatile image enhancement tools of Planmeca Dimaxis open up new possibilities for diagnostics and improve the overall diagnostic value of radiographs.

Planmeca Dimaxis comes with Solid EmbeddedEngine™ database, providing a professional solution for image storage. The database ensures automated and secure storage of all image information; automated back-ups meet the strictest requirements of data security and prevent all loss of clinical information.

The Planmeca Dimaxis imaging software is 100% DICOM compliant. (The abbreviation stands for 'Digital Imaging and Communications in Medicine' and is a worldwide standard for the transfer of images between medical information systems.) Planmeca Dimaxis is also fully ADA compliant and provides, as an option, the widest possible DICOM functionalities.

Planmeca TWAIN Driver allows for direct digital X-ray image acquisition into a third party imaging software. It also allows another vendor's TWAIN compliant imaging software to directly acquire digital images taken with Planmeca ProOne.

The full colour TFT display has a graphical user interface (GUI) that guides the operator with text and clear graphic symbols. The GUI design is based on cognitive ergonomics; hence all settings are logically grouped and easy to understand. This hastens the imaging procedure and allows the operator to fully focus on patient positioning and communication. All necessary information is shown on the main display with a hygienic wipe-clean surface.

As the jaw size and shape varies from one individual to another depending on size, gender, race, and age, one fixed panoramic focal layer form cannot be optimal for every patient. On the graphical user interface, the operator may adjust the shape of the focal layer according to the jaw size and shape characteristic to the patient.

The unique digital Dynamic Exposure Control (DEC) optimises the whole imaging chain individually for each patient. All components from the X-ray generator to the digital sensor are tuned to produce the optimum image quality.

A self-diagnostic control system continuously monitors the unit. The system displays help messages which guide the operator and enable the correct use of the unit. The control system also displays error messages in case of abnormal operation. These error messages are stored in an error log to help both the operator and the technical service.

**Minimum operational space requirements**

Width	Depth	Height
130 cm	130 cm	223 cm
51 in.	51 in.	88 in.

Generator	Constant potential, resonance mode high frequency 60 - 80 kHz
X-ray tube	D-0585BR
Focal spot size	0.5 x 0.5 mm (IEC 336)
SiD	480 mm (19 in.)
Total filtration	min. 2 mm Al eq.
Anode voltage	60 - 70 kV
Anode current	2 - 7 mA DC
Exposure time	2 - 10 s
Magnification	1.22 - 1.29
Line voltage	100 - 132 V~ 50/60 Hz, 180 - 240 V~ 50 Hz
Regulation	± 10 % (automatic)
Line current	8 - 16 A
Power uptake	max: 850 W
Chin rest level	95 - 178 cm (37.4 - 70 in.)
Colour	RAL 9016 (white)
Weight	69 kg (152 lbs)

**Software features**

1. Basic programs
  - Standard Panoramic
  - Pediatric Panoramic
  - Lateral Double TMJ
  - PA Double TMJ
  - PA Sinus
2. Horizontal and vertical segmenting
3. Advanced programs
  - Improved Interproximal
  - Improved Orthogonal
  - Bitewing
  - Lateral-PA Double TMJ
  - Lateral 3-angle TMJ (left or right)
  - Lateral Sinus (left or right)
  - Lateral Midsagittal Sinus (left or right)
  - Cross-sections, manual or automatic
4. DEC (Dynamic Exposure Control)

*Planmeca Oy designs and manufactures a full line of high technology dental equipment, including dental care units, panoramic and intraoral X-ray units, and digital imaging products. Planmeca Oy, the parent company of the Finnish Planmeca Group, is strongly committed to R&D, and is the largest privately held company in the field.*
